

**METHODS, DEVICES, AND SYSTEMS FOR DISPLAYING
INFORMATION FROM A REMOTE ELECTRONIC DEVICE**

ABSTRACT

5 Information from a handheld electronic device can be shown on a video screen
that is remote from the electronic device. More particularly, information can be
provided within a handheld electronic device, and communicated from the handheld
electronic device to a receiver over a wireless coupling. A video signal is generated
responsive to the information communicated over the wireless coupling, and the video
10 signal is provided for display on the video screen. More particularly, the information
can be communicated over the wireless coupling according to a Bluetooth protocol.
Related methods, systems, and devices are discussed.
